0. IDENTIFY THE ITEM!!! → Grace

packing algorithm → Grace

1. safety regulations (i.e. power banks can only go in carry-on, scissors can only go in checked) it's preferred if some things go into carry on (meds, docs, valuables, change of clothes => give more weight to these things go into carry on → give more weight to putting on top

2. dimensions → Anna

2. dimensions computing algorithm: user takes a picture of all items next to their suitcase and enters dimensions of their suitcase program computes a pixels to inches ratio and applies it to surrounding items (problem: distortion in 2D. maybe Google reverse img search? cannot determine size of shirt tho... can divide objs into cats where Google reverse img search are accurate and others that are not. however S vs. L does not matter for t-shirts, but def. for thicker jackets +bd)

3. weight dude identify objs!!! scrape their weight → Grace

4. packing in layers: cat 1 = rigid stuff (shoes, books) cat 2 = semi-rigid stuff (clothes, pants) cat 3 = poufty stuff (puffer jacket/pillow) when a cat is finished start on another if the layer is not → Anna

5. consider all liquids as 1 entity and a pair of snow as an entity

6. move, wear, leave → Grace
